

What each same-source arm actually adds: geometry and colour versus a new hazard state

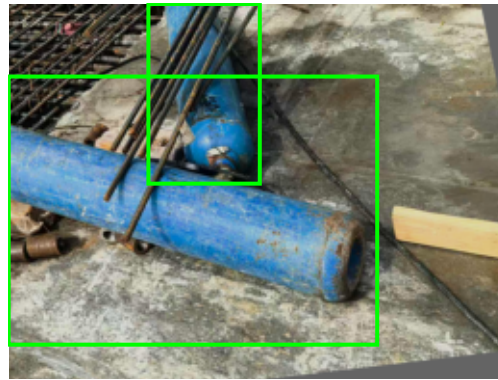

A: real seed photo (real_photo_30)

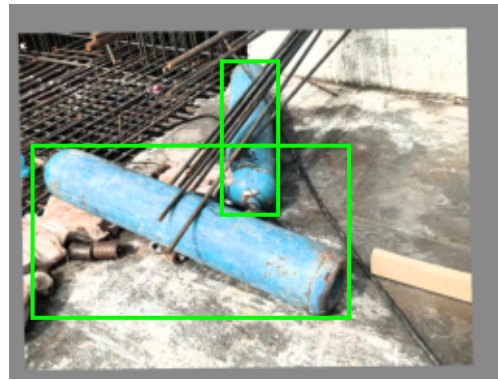

B: classical aug 1

B: classical aug 2

B: classical aug 3

C: generated sample 1

C: generated sample 2

C: generated sample 3

Top row: one real seed photo (A) and three variants produced by the exact augmentation function used to build the B arm; boxes are carried through every transform. Rotation and down-scaling pad with grey, so a variant can carry grey margins - a property of this arm, not a rendering artefact.

Bottom row: generated samples (C) in sampling order - Placement_Issues_0001.png, Placement_Issues_0554.png, Placement_Issues_0515.png.

The generation step kept no source-image mapping, so these are not edits of the photo above; the pairing is illustrative only. All boxes are the reviewed human labels.
